

mesa2 - hand measurement sheet (LEFT hand; mirror for right)

100.0 mm - print at 100%, no scaling

- 1. Tape this down. Sit as you type. The datum line at the bottom goes parallel to the desk edge.
- 2. Ink the pad of each fingertip (washable marker). Do NOT hold a pen - it changes the whole posture.
- 3. Rest the hand naturally, then TAP each finger straight down. That is the home row. Label the dots.
- 4. Curl each finger one row further and tap again. Two dots per finger = the column's direction.
The line through a finger's two dots IS its splay angle. That is the measurement worth having.
- 5. Thumb: sweep it through its comfortable arc and tap 4-5 times along the way. Do not aim for a line - the thumb pivots at the base, so those dots fall on an arc, and the arc gives both angle and distance.
- 6. Mark where the heel of your palm rests. Repeat the whole thing twice more on fresh sheets.

origin (0,0) at the red cross - X to the right, Y toward you
